

BOH Kitchen Dashboard

Executive briefing | Overview, purpose, delivery, and architecture

OVERVIEWHost · server · data layer

The application is a static front end hosted on GitHub Pages (no dedicated app server); the browser is the client. Weekly kitchen timing from Toast (and OpenTable covers) is processed into venue JSON, published to Firebase, and embedded into

01 Why
Business purpose

One operating view of kitchen pressure, station fulfillment, staffing throughput, and portfolio comparisons across Claudie, Casa Neos, AVA CG, AVA WP, and MILA · so chefs and ops share a single source of

02 How
Delivery approach

Built in Cursor on toast-mcp-server + boh-rdg-publish (Node + dashboard.html). weekly-save / staffing scripts fill venue JSON; build-unified-v2 embeds + live-merges Firebase. Local preview as

03 Where
Environment & testing

Live test surface: mlavenant.github.io/boh-dashboard. Source: MLavenant/boh-dashboard (main). Data: Firebase rdg-dj-dashboard (/rdg/boh). Cloud test: GitHub Actions windows-latest

ARCHITECTURE

End-to-end path from development to live operations

Host = GitHub Pages · Client = browser · Data server = Firebase · No dedicated application server
